

Creation of chat room

After 3 back and forth comments between 2 users, a text under the comment thread will appear and give the option to automatically create a chat room.

Is there a reason why databases such as `MySQL` and `MongoDB` doesn't work for you? – [Cosmos Zhu](#) 11 mins ago

▲ @CosmosZhu I've looked around and found that having `MySQL` or `MongoDB` would mean the electron app can't be "portable" so that it can be distributed easily. – [Cosmos547](#) 10 mins ago

What about `sqlite` it stores the database in a file and both `python` and `node` have modules which can interact with a `sqlite` database. – [Cosmos Zhu](#) 9 mins ago

▲ @CosmosZhu `sqlite` does seem to work. Do you have other suggestions for a database that's also in JSON form like `tinydb`? – [Cosmos547](#) 2 mins ago

Is there a reason you want to create the database in Python? If using javascript to both create the database then the option to choose a database will be so much easier. – [Cosmos Zhu](#) 1 min ago [Edit](#)

▲ @CosmosZhu I've already implemented the processing stage by Python and only want to use it in electron. I guess it makes sense to port it into javascript so that the same database can be shared. Do you have any suggestion for a database for javascript that would serve the need? – [Cosmos547](#) 4 secs ago

Please avoid extended discussions in comments. Would you like to [automatically move this discussion to chat?](#)

The chat room is then automatically created with all comments between the 2 users imported.

0 Q: How to create a databale for electron app from python 14:37

I want to create a database with Python and then use this database in a Electron app. There are a few requirements that I wish the process satisfies: The database shared should be in a file format Ideally the database created by Python can be used directly in node without much trouble Plus if ...

`python` `node.js` `database` `electron`

Cosmos Zhu (removed)

Cosmos547 @CosmosZhu I've looked around and found that having `MySQL` or `MongoDB` would mean the electron app can't be "portable" so that it can be distributed easily.

Cosmos Zhu What about `sqlite` it stores the database in a file and both `python` and `node` have modules which can interact with a `sqlite` database.

Cosmos547 @CosmosZhu `sqlite` does seem to work. Do you have other suggestions for a database that's also in JSON form like `tinydb`?

Cosmos Zhu Is there a reason you want to create the database in Python? If using javascript to both create the database then the option to choose a database will be so much easier.

Cosmos547 @CosmosZhu I've already implemented the processing stage by Python and only want to use it in electron. I guess it makes sense to port it into javascript so that the same database can be shared. Do you have any suggestion for a database for javascript that would serve the need? 14:37
